

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

BIBLIOGRAPHICAL INDEX
OF
NORTH AMERICAN FUNGI

BY
WILLIAM G. FARLOW
*Professor of Cryptogamic Botany in Harvard
University*

VOL. I.—PART I.
ABROTHALLUS TO BADHAMIA

BOSTON, MASS.
U. S. A.

PREFACE.

THE present Bibliographical Index owes its origin to the fact that in 1874, when the writer returned from Europe where he had spent a couple of years in the study of mycology, he found it impossible to ascertain what species of fungi were known to occur in the United States. With the exception of the two monographs of Schweinitz, issued in 1822 and 1834, the accounts of North American fungi were scattered through numerous papers in the publications of learned societies, many of them difficult to obtain, in various State reports and in horticultural and agricultural journals. Berkeley and Curtis' Notices of North American Fungi, begun in Grevillea in 1872, were then in progress of publication, but the student who desired to find out what was known of our fungi was forced to spend a large amount of time in hunting up in the larger libraries the many scattered and often obscure works from which information could be obtained. The writer then determined to bring together all references to North American species in the form of a card catalogue, not an easy matter at that date. At the same time an authors' catalogue was started including the titles of all the works used in forming the catalogue of species. The authors' catalogue was printed in 1887 as Bibliographical Contribution No. 25 of the Library of Harvard University under the title, "A List of Works on North American Fungi," by W. G. Farlow and William Trelease. This included 653 titles, and was followed in 1888 by a Supplemental List, by W. G. Farlow, being Bibliographical Contribution No. 31, bringing up the number of titles to 756. The authors' catalogue has been continued and a new edition is in preparation, including the parts previously issued with additions up to 1905.

As originally planned the Index included as species of North American fungi all those known north of Mexico, but in recent years the species of our southern border have proved to be so intimately connected with those of the West Indies, Mexico and Central

IV

America that it seemed necessary to extend the limit of the Index to species of all countries north of the Isthmus of Panama. In the following pages where a species has been recorded only in countries south of the United States, the name of the region where it occurs is given on the right hand side of the page, but where a species occurs both in the United States and regions farther south no special indication is given. Had it been possible, it would have been desirable to include also species of the northern part of South America, but the line had to be drawn somewhere, and to include South American species would have required an additional amount of work hardly warranted under the circumstances. As it is, we have given all the references known to us to West Indian and Central American species published in recent years, and, to the best of our ability, we have inserted the species recorded from those regions in works issued prior to 1888, but not included in the List of 1887 and the Supplementary List of 1888. The references given from works relating especially to the fungi of the West Indies and Central America are probably comparatively complete, but it is probable that some references to species of those regions originally scattered in papers treating also of the fungi of other countries have escaped our notice.

The *Sylloge Fungorum* of Saccardo, of which the first volume appeared in 1882, has been of the greatest assistance to American mycologists in furnishing a summary of all known species, but naturally in a work covering so large a field it is not possible to give, except in a brief way, special references to the literature of fungi in any particular country, and the *Sylloge*, although indispensable, does not do away with the necessity of having a special index to the works in which our species are recorded. The need of such an index has been felt in all our universities where the study of descriptive mycology is pursued, as well as in the numerous experiment stations and other government establishments devoted to vegetable pathology. In the absence of such an index it has been necessary for different institutions to spend much time and money in duplicating the work begun by us in 1874, and for a long time we have wished to publish our index which, as it has been in progress for a longer period than any similar index in this country, is probably therefore more complete, in order that it might be used by all mycologists and prevent an unnecessary duplication of labor and expense. The cost of printing, however, was so great that it has

been impossible to obtain the means of publication until the Carnegie Institution offered to provide the funds for printing the volume of which the first part is now ready.

The Index, it should be borne in mind, does not purport to be a summary of all references to North American fungi, but is limited to those which concern the systematic mycologist, and does not include references to papers on fungicides and other technical and agricultural subjects as such, but cites them only when they also contain notes of interest to the systematist. The literature of these branches of applied mycology is already sufficiently fully given in different government publications and technical journals. Nor have we included, in general, references to works treating specially of the physiology of fungi, for the reason that physiological questions are from their nature general and not local. The physiology of North American fungi is not different from that of fungi of other parts of the world, whereas the study of our species from a systematic point of view has a definite local as well as a general importance. What is true of physiological writings is to a great extent true of cytological writings, but we have introduced references to important cytological works published in this country based on material collected here since they have a bearing on morphology and classification. Bacteria and Saccharomycetes are excluded, as those groups at the present day are studied by specialists and not by those interested in what are commonly known as fungi proper.

With these exceptions the Index includes all the references to species of North American fungi known to us, but it should be remarked that in the case of a few species, as *Agaricus campestris*, which are very common and which from their popular interest have appeared over and over again in journals of every description, we have omitted many references and given only those which are of importance as showing their range or as furnishing good illustrations. As it is, we may perhaps be considered to have been over liberal. It should also be remarked that we have cited only references to North American species as they occur in North America and have not given references to North American species as they occur in Europe. A few perplexing cases have arisen in which new species have been described in Europe parasitic on plants recently imported from America. The supposition is in such cases that the fungi themselves were imported from America and we have accord-

ingly given notes on some of them, but in other cases it seemed to us doubtful whether the parasites were really American.

In the case of genera we have not thought it necessary to give special references except in the case of those peculiar to North America or first described in North America, or in cases where American writers have given critical notes on certain genera found in Europe as well as America. When we have had any reason for differing from other writers as to limits of genera our opinion is given in the form of notes.

We have endeavored to bring the references as nearly up to date as possible, but it was not practicable to hold in type so large a mass until the whole of the present part was finished. The reader must therefore expect to find the later pages more nearly up to date than the earlier ones, since pages 1-64 were struck off in December, 1903, while pages 225 to 312 were not printed until August, 1905. It is proposed to give at the end of the volume the addenda to the earlier pages. The progress of the work has been slow, partly owing to delays to be expected in starting a work of this kind, and also to the fact that the two large and very complicated genera, *Accidium* and *Agaricus*, required a simultaneous arrangement of other genera to appear later.

A word should be said as to the system of classification and the limitations of genera and species which we have followed. In general, while giving as much information as we were able, we have tried as far as possible to avoid changing names in common use for many years. At the present day the *Sylloge* of Saccardo and the *Pflanzenfamilien* of Engler and Prantl may be said to be the two works on the classification of fungi in most general use, and we have preferred to follow them as far as possible, making the changes required in consequence of information obtained either from recent critical monographs by those who have made a special study of different orders and genera or from our own examination of American material. We are quite ready to admit that the present classification of fungi is not one which can be called more than temporary, but the time has not arrived when our knowledge of the fungi of the world is sufficiently advanced to make it possible to form a really natural and scientific system.

We have followed the principle of adopting the oldest specific name under which a species was described. We cannot say that

this method seems to us to be better than any other but, as it is, it is so generally adopted by mycologists and furthermore, since it was voted by the botanists at the recent Congress in Vienna that this plan should be followed in Spermaphytes it seems desirable that all botanists should conform to it. We do not, however, propose in adopting this system to follow it blindly, but in all cases we would accept an older name only when it is quite plain, and not merely possible, or somewhat probable, that the species described by an older writer was the same as that which is generally known under another more recent and more certain name. We have no scruples in declining to accept many of the names of older writers which have of late been substituted for more modern names since from the vagueness of the descriptions and the crudeness of the illustrations it is impossible in the absence of original specimens to be sure that the species were the same as those to which they have since been applied.

There are two categories of botanists: those who believe that nomenclature is an end rather than a means, to whom the changing of names to adapt them to a uniform, automatic system seems to be the important aim in science; and those who regard nomenclature as a necessary evil which can be mitigated by making as few changes as possible. Of these two categories, it is hardly necessary to say that we should prefer to be classed with the latter. Great as is the difficulty of recognizing the identity of the species of early writers in the case of Spermaphytes, it is still worse in the case of fungi, if we accept 1753 as the limit, for the early writers did not make use of the microscopical characters now considered necessary and we must confess that we feel that too much value should not be placed on original specimens of species in which the microscopic characters are important. It has happened in several cases that those who have examined original specimens of certain of the smaller Schweinitzian species do not agree as to their structure, for which the most probable reason is that Schweinitz, not using microscopic characters, did not distinguish between different species of the same general appearance. Such species we have relegated to the limbo of *species ignotæ* since we have felt under no moral obligation to make it appear that Schweinitz recognized distinctions which he certainly did not recognize. It is best not to make too violent attempts to interpret the older mycologists but to be content with letting the dead

VIII

bury their dead. The business of reviving corpses has been carried altogether too far in mycology. American mycologists, it must be confessed, are peculiarly gullible as far as accepting as authentic much that is offered to them in the way of treatises on the genera and species of earlier mycologists. An examination of some of them, at least, shows that they are as inaccurate as they are useless. No one who uses the Index can complain justly that we have not provided him with names enough, good, bad and indifferent, and those who examine it with care will probably be surprised at the large number of names which have been encumbering the literature of our fungi as *nomina nuda* or as names of species about which we are and probably always shall be ignorant. At the Vienna Congress it was voted to accept a list of certain genera of Spermaphytes whose names are to be retained regardless of strict priority. It is to be hoped that at the next congress a similar list of cryptogams will be presented so that in the case of genera clearly defined and generally recognized under names in use for many years, they may be regarded as fixed and exempt from future changes on the ground of priority.

Although the undersigned must be held responsible for the plan and general character of the Index, and must be held answerable for the defects which those making a practical use of it will undoubtedly detect, it is not to be supposed that a work involving so large an amount of labor could have been accomplished without the collaboration of several persons, and the writer wishes in this place to state in detail the manner in which the work has been conducted, and to give proper credit to those who have taken part in it. For a few years beginning in 1874, the indexing was done by the writer himself, but since 1883 his occupations have made it necessary to intrust the main part of the indexing itself to others, while he has had to limit himself to a general supervision of the work, to the examination of authentic specimens involved in settling the nomenclature, and to a search through contemporary foreign literature and scattered papers published in the earlier days of mycology bearing directly or indirectly on North American species. Since 1883 the indexing has been done by Mr. A. B. Seymour, with necessary clerical assistance, with the exception of the year 1885-86, when, during Mr. Seymour's absence, Prof. L. H. Pammel was in charge. By far the greater part of the work of indexing, it will be seen, has been

IX

done by Mr. Seymour, and to his persistence under difficulties, his care and his interest in the subject, those who use the Index will be indebted. During the considerable number of years when there appeared no immediate prospect that the Index could be printed the accumulation of material went on until it was estimated that about 150,000 references had been brought together. When in 1903 the Carnegie Institution expressed to the writer its willingness under certain conditions to undertake the publication, it was necessary to revise the large mass of data and put it in form for printing since, owing to the numerous cross references, the cards could not be printed directly. Mr. Seymour then brought together the various cards of synonyms and arranged them critically in chronological order, or segregated them, as the case required. They were then revised by the writer to conform to the general plan adopted, and, in cases of disputed or confused synonymy, examinations of authentic specimens were made, and, where it seemed to be of interest, the results of the examinations taken in connection with collateral reading were embodied in the form of notes under different genera and species. Unless otherwise stated, the notes are all by the undersigned, and in cases where Mr. Seymour had made a critical examination the notes were written by him and are signed with his initials. For the arrangement and relations of the acedia of Gymnosporangia, the *Laboulbeniaceæ*, *Entomophthoraceæ* and certain genera of other orders specially studied by him, we are indebted to Prof. R. Thaxter as well as for advice on general questions. We are indebted to Mr. A. P. D. Piguet for valuable suggestions made during the proof-reading. We also wish to acknowledge with thanks critical information furnished by the following mycologists: Prof. J. C. Arthur, Prof. G. F. Atkinson, Prof. E. A. Burt, Mr. J. B. Ellis, Prof. E. W. D. Holway, Prof. W. A. Kellerman, and Prof. C. H. Peck.

References are arranged chronologically under names of species and synonyms.

BOLD FACE TYPE indicates number of the volume.

ROMAN NUMERALS (capitals), number of the series.

ROMAN NUMERALS (lower case), page numbers of works in which both Roman and Arabic figures are used in the originals.

d., description; *pl.*, plate; *f.*, figure.

n.n. Nomen novum.

nom. nud. Nomen nudum.

[] Secondary title.

() Paging of reprint.

* *Before a reference*, specimens in exsiccati.

* *After a reference*, signifies that it relates to foreign, not to American material.

? *Before a specific name*, signifies that it is doubtful whether the name is properly placed as a synonym.

? *After a specific name*, that it is doubtful whether in the references cited under it the species has been determined correctly.

Dates on which pages went to press:

1- 64	Dec., 1903.
65- 96	July, 1904.
97-160	March, 1905.
161-192	June, 1905.
193-224	July, 1905.
225-312	Aug., 1905.

BIBLIOGRAPHICAL INDEX OF NORTH AMERICAN FUNGI.

Abrothallus Parmellarum, (Sommf.) Nyl.
Rostr. Meddelelser om Grœnl. 3: 613. 1891.

NOTE. The species of *Abrothallus* have until recently been considered to be lichens, and references to North American species will be found in works on lichens which cannot be included here. The single species here given is a common parasite of *Parmelia* in the North Eastern States and probably throughout the United States. *Abrothallus oxysporus*, Tul., now placed in *Nesolechia*, is given as *Buellia oxyspora* in Tuckerman, Syn. N. Am. Lichens 2: 29.

Acallomyces, Thax.
Thax. Proc. Am. Acad. 38: 23. d. 24 June 1902.

Acallomyces Homalotæ, Thax.
Thax. Proc. Am. Acad. 38: 24. d. 24 June 1902.

Acalyptospora Populi, Pk.
Pk. Rept. N. Y. Mus. 35: 139. d. 1885.

NOTE. *Acalyptospora nervisequia*, Desm., the type of the genus, is now considered to be a distortion due to insects and not a fungus. Whether *A. Populi*, Peck is still to be classed with fungi is uncertain, and we are informed by Professor Peck that the original specimens of his species cannot now be found and he is unable to express an opinion on the subject.

Acanthomyces, Thax.
See *Rhachomyces*, Thax.

NOTE. On grounds of priority *Acanthomyces* was changed to *Rhachomyces*. See Thax. Proc. Am. Acad. 30: 467, 468. d. 18 Feb. 1895.

S. Syn. Am. Bor. 275 no. 2562. 1834.

NOTE. See Sacc. Syll. 4 : 761. 10 April 1886. Is this perhaps an *Hypochnus*?

Aerothecium, (Preuss) Sacc. emend.

NOTE. *Aerothecium* founded by Corda as a subgenus of *Trichothecium*, *Icones* 2 : 10, 1838, with the species *A. parasitans*, which is placed in the genus *Blastotrichum*, Sacc. Syll. 4 : 191, 1886, was raised to generic rank by Preuss, *Linnaea* 24 : 110, 1851, where Corda's generic description was retained and the species *A. multisporum* described. The latter species was again described and figured in Sturm's *Deutschlands Flora*, 3 Abt., xxx, 85, f. 43, of which the exact date is uncertain, but apparently about 1851 or 1852. The description of the genus in Sturm is again Corda's original description with the addition of a (?) after one word. In *Michelia* 1 : 75, 1 June 1877, Saccardo extended the genus to include *Cordana*, Preuss and *Aerotheca* Fuckel without generic description. In *Michelia* 2 : 29, 25 April 1880, the genus was described by Saccardo and the authority given as Corda, but in Sacc. Syll. 4 : 483, 1886, the authority is given as (Preuss) Sacc. emend. Lindau in Engler & Prantl, *Pflanzen-fam.* 1^{1**} : 481, follows Saccardo's limitations, but gives Preuss as the authority.

Sacc. Cub. & Manc. Syll. 6: 691. *d.* 1 Aug. 1888.
Cke. Grev. 20: 11. Sept. 1891.

NOTE. The genus *ACurtis*, Fr. was founded on *Clavaria gigantea*, S. which by later writers has been recognized as a monstrosity of some species of *Lentinus*. Writers are not agreed as to whether the species is *Lentinus tigrinus* (see B. Gard. Chron. II. 9: 339. 16 March 1878) or *Lentinus lepideus* (see W. G. Smith, Jour. Bot. 41: 322. Oct. 1903).

Aecidiella, Ell. & Kelsey.

See *Puccinosira*, Lagerh.

Aecidiella Triumfettae, Ell. & Kelsey.

See *Puccinosira pallidula*, Lagerh.

Aecidium, P. Including *Peridermium*, (Lk.) Lev. and *Ræstelia*, Reb.

NOTE. Under the genus *Aecidium* are included all our æcidial forms whether their connection with definite teleutosporic forms is known or not. Where such connection is not yet known we have given all the references to the species known to us. Where such connection is known or is strongly suspected we have given under the æcidial name the references to the æcidial form itself with a cross-reference to the uredosporic and teleutosporic forms, where incidental references to the æcidia may also be found.

It should be remarked that the modern method of studying the Uredineæ by infection experiments has resulted in the recognition of many races or form-species, and the older characterization and nomenclature of æcidial forms can be regarded only as temporary.

Aecidium abietinum, A. & S.

NOTE. The species of Albertini and Schweinitz has been shown to include two forms: one connected with *Chrysomyxa Rhododendri*, the other with *Chrysomyxa Ledi*. (See DeBary, Bot. Zeit. 37: 761 *et seq.* 1879, and, Schroeter, Beitr. Biol. Pflanzen 3: 51. 1879.) The *Aecidium abietinum* A. & S. (*Peridermium abietinum*, Thm.) as used by American mycologists probably does not include the form connected with *Chrysomyxa Rhododendri*, as that species has not been reported in America. Some of the references relate to the æcidial form of *Chrysomyxa Ledi*, but uncertainty exists in other cases because under *Aecidium abietinum* some writers have included as var. *decolorans*, Thm. the *Peridermium decolorans* of Peck.

For references to forms probably connected with species of *Chrysomyxa* on *Ledum* see Farl. Appalachia 3: 239, Jan. 1884, and Proc. Am. Acad. 20: 320, 1885; also Schroeter, Beitr. Biol. Pflanzen l. c. and Ber. Schles. Ges. 1887: 279.

Aecidium (Peridermium) abietinum, (Fung. Columb. 1479).

NOTE. The locality and host make it probable that the specimens in this case belong to a species which is not identical with those elsewhere given under *Aecidium abietinum*.

NOTE. The form on *Actæa spicata* according to Ed. Fischer Bot. Centralbl. **83**: 75, 17 July 1900, and Fortsetzung Entwickl. Untersuch. ueber Rostpilze, Ber. Schweiz. Bot. Ges. **11**: 4-9, 1901, belongs to *Puccinia Actææ-Agrophyri*, Ed. Fisch. The authority for the æcidial name is given as Opiz by most authors, who evidently follow Wallroth (1833), and the date as given by Schroeter (quoting Steudel) is 1824. It should be noticed that the name *Aecidium Actææ* occurs in Muhlenberg's Catalogue, 1813, where no authority is given.

Ell. & Ev. Jour. Myc. 1 : 141. d. Nov. 1885.

NOTE. The teleutosporic stage of this species is usually understood to be *Puccinia Adoxæ*, D C., but Bubák in Centralbl. Bact. 2 Abt. 10 : 574, 1901, considers it to belong to *Puccinia argentata*, (Schultz) Wint.

Aecidium albiperidium, Arth.

Arth. Jour. Myc. 8 : 53. d. 30 June 1902.

NOTE. The above name is given to an *Aecidium* produced by sowing on *Ribes Cynosbati* teleutospores obtained in the field on *Carex pubescens*. The teleutosporic stage is called *Puccinia albiperidia*, Arth. See also Davis, Tr. Wis. Acad. 14 : 86, Sept. 1903, where it is stated that this is probably the same as *Aecidium Grossularia*, P. See also Klebahn, Pringsh. Jahrb. 34 : 388 and 35 : 701. 1900.

Aecidium album, Clint.

NOTE. In Hedw. 36 : 297, 25 Oct. 1897, Dietel describes as new the teleutosporic stage of this species, using the name *Uromyces albus*, (Clint.) Diet. For synonymy of the æcidial stage see Diet. Hedw. 28 : 183, June 1889, and Anderson, Jour. Myc. 6 : 121, 6 Jan. 1891. See also *Aecidium porosum*? under *Uromyces Coloradensis*, Ell. & Ev. Erythea 1 : 204, Oct. 1893.

Cke. Grev. 8: 34. Sept. 1879.

NOTE. See Sydow, Mon. Ured. 1: 517. 15 May 1903. North American specimens of *Accidium Barbareae* probably belong to *Puccinia Barbareae*, Cke.

Accidium Berberidis, P.

NOTE. This form belongs to *Puccinia graminis*. The following references are all that it seems desirable to insert here, for although the *Accidium* has frequently been mentioned, the references are mainly in popular writings or are of slight value to mycologists.

Pk. Rept. N. Y. Mus. **27**: 104. *d.* 1875.

Pk. Rept. N. Y. Mus. **29**: 77. 1878.

NOTE. This *Aecidium* is the æcidial stage of *Puccinia Convolvuli*, Cast.

Aecidium cancellatum, (Jacq.) P. in Gmel.

NOTE. There is good reason for supposing that few if any of the following references to *Aecidium cancellatum* really relate to the European species of that name which is connected with *Gymnosporangium Sabinæ*, (Dicks.) Wint. This *Gymnosporangium* has been recorded in America on an imported species of juniper, although it is very rare, but, supposing that the determination of the species in that case is correct, there is no reason why the true *Aecidium cancellatum* might not be found also.

***Aecidium candidum*, P.**

See *Cystopus candidus*, Lev.

***Aecidium carneum*, (Bosc.) n. n.**

NOTE. We have placed under *Aecidium carneum* references to the foliicolous forms of *Aecidium* on *Pinus palustris* and doubtfully on some other species of *Pinus* of the southern states, for, although the original specimens of Bosc are not to be found in that part of his herbarium, now at Padua, his original figure and description make it probable that his *Tubercularia carnea* included what has generally been called by American mycologists, *Aecidium orientale*, Cke. which is an Indian species. It should be added, that although according to Cooke, Bull. Soc. Bot. Fr. 24 : 315, Oct. 1877, *Aecidium orientale* is a foliicolous species, the name has been extended by collectors to include in some cases corticolous forms. Inasmuch as the corticolous and foliicolous forms of *Aecidium Pini* have been shown by experiment to belong to several distinct species it is not improbable that the same may prove to be true in the present case. But in the absence of cultures to show the development of the *Aecidia* of this group, the arrangement here given must be regarded as one of convenience only. See also note under *Aecidium Pini*, (Willd.) P.

Sacc. Syll. 11 : 217. d. July 1895.

Aecidium Compositarum, Auct. Amer. p. p.

NOTE. Very little is known in regard to the development of the *Aecidia* on *Compositæ* in America, but some belong to autœcious and others to heterœcious species. The number of references is so great and in some instances they are so uncertain that for practical use by mycologists it has seemed best under *Aecidium Compositarum* to group the *Aecidia* on all the genera of *Compositæ*.

Where in the original references no particular host-genus is mentioned, the references are grouped chronologically with the heading of *Miscellanea*. Where definite genera are mentioned, the hosts are arranged alphabetically, each with its references; e. g., all references to *Aecidia* on *Ambrosia* are placed under *Aecidium Compositarum*, var. *Ambrosia*.

For information in regard to European *Aecidia* on *Compositæ* see Jacky, Die Compositen-bewohnenden Puccinien von Typus der *Fuccinia Hieracii* und deren Specialisierung, Inaugural Diss. Bern 1889 and Zeit. Pflanzenkr. 9 : 193, 20 Oct. 1899; Klebahn, Bot. Zeit. 58 : 133, 1 May 1900, and Magnus, Hedw. Beibl. 39 : (147), Oct. 1900. Also see Magnus, Ber. Deutsch Bot. Ges. 11 : 453, 29 Aug. 1893, and Lindroth, Ueber einige Compositen-bewohnende Puccinien, Acta Soc. Fauna et Fl. Fennica 20⁹ : 1901.

NOTE. This is the aecidium of *Melampsorella Caryophyllacearum*, (D C.) Schrt. See Ed. Fischer, Ber. Deutsch. Bot. Ges. 19: 397. 26 June 1901, and Zeit. Pflanzenkr. 12: 193. 7 Oct. 1902. It may be remarked that the distribution of *Melampsorella Caryophyllacearum*, (D C.) Schrt. in the Eastern United States corresponds with that of *Aecidium elatinum*. For further information see Klebahn, Rostpilze 396. 1904.

Acidium Epilobii, D C. On **Epilobium**.

NOTE. The true *Acidium Epilobii*, D C. belongs to *Puccinia Epilobii-tetragoni*, (D C.) Wint. and we have included here references to *Acidia* on species of *Epilobium*, most of which at least seem really to belong to this species. With regard to the references here given to *Acidia* on species of *Oenothera* there is some doubt, for although by recent writers they are generally placed here, their position cannot be considered certain. Compare also *Acidium Oenotheræ*, Pk.

Aecidium Euphorbiæ, S.

NOTE. *Aecidium Euphorbia*, P. in Gmel. 1791 was shown by Schroeter, Hedw. 14: 98. July 1875 to be the *Aecidium of Uromyces Pisi*, (P.) D By. This *Aecidium* on *Euphorbia Cyparissias* must be rare, even if it occurs at all, in the United States and we find scanty references to *Uromyces Pisi* in this country unless it has been published under some synonym which we are not able to recognize. See also Jordi, Centralbl. Bact. 2 Abt. 10: 777. 3 Sept. 1903 where *Uromyces Astragali*, (Opiz) Sacc. is said to have

its æcidium on *Euphorbia Cyparissias*. For further information consult Klebahn, Rostpilze 330. 1904.

The *Æcidium Euphorbiae*, S. dates from 1822 and is the æcidium of *Uromyces Euphorbiae*, C. & P. (see Magnus, Ber. Deutsch. Bot. Ges. 14: 376. 28 Dec. 1896) and under this name we give all references to *Æcidia* on different *Euphorbiae*, since evidently the greater part relate to the æcidium of *Uromyces Euphorbiae*, C. & P. Some references, especially those pertaining to the Western States, may perhaps be distinct but at present their development is unknown. Several species of *Uromyces* are known on *Euphorbia* in North America but some of them are believed to be destitute of an æcidial stage. See also Arth. Bot. Gaz. 29: 270. 20 April 1900 and Jour. Myc. 8: 51. 30 June 1902 and Carl. Science II. 13: 250. 15 Feb. 1901.

Aecidium Geranii*, Auct. Amer.**See *Aecidium Geranii-maculati*, S.Aecidium Geranii-maculati*, S.**NOTE. Under this name Schweinitz in 1822 described an *Aecidium* on *Geranium* which was not recorded again by any other American botanist till 1865. The Schweinitz species had been assumed to be identical with *Aecidium Geranii*, D.C. which is said to belong to *Uromyces Geranii*, (D.C.) Otth & Wartm. until Lindroth, in 1900, regarding the two as distinct, gave the name of *Aecidium sanguinolentum* to the common North American form. From the description of *Aecidium Geranii-maculati* given by Schweinitz we feel justified in regarding *Aecidium sanguinolentum*, Lindr. as a synonym. See also Klebahn, Rostpilze 322. 1904. See also *Aecidium violascens*, Frel. on *Geranium erianthus* in Alaska.

***Aecidium Gilliae*, Pk.**

NOTE. Although *Aecidium Gilliae*, Pk. and *Aecidium Polemonii*, Pk. resemble one another, in the absence of cultures to show their identity, they are here kept distinct. Under the first named species we have placed those

references to *Aecidia* on *Gilia* and *Phlox* which are assumed to belong to *Puccinia plumbaria*, Pk. including the *Aecidium Wilcoxianum* of exsiccati, of which, so far as we know, no description was ever published.

Specimens in different exsiccati of *Aecidium Phlogis* seem to us not to differ from *Aecidium Giliae*, Pk. *Aecidium Phlogis*, Pk. cited by Arthur, 1885, should probably be in part *Aecidium Polemonii*, Pk. as there is no *Aecidium Phlogis*, Pk. and *Aecidium Phlogis*, Ell. & Ev. dates from 1897. *Aecidium Polemonii* has also been recorded in several cases on *Phlox pilosa*, but the name in this case is doubtful and we are not able to refer the *Aecidium* in question to *Aecidium Giliae*, Pk. with certainty nor does it seem to be the true *Aecidium Polemonii*, Pk.

The form on *Phlox divaricata* called *Aecidium Polemonii* is probably *Aecidium Giliae*, Pk.

Aecidium globosum, (Farl.) n. n.

NOTE. Under this name are given references believed to relate to the aecidium of *Gymnosporangium globosum*, Farl. which was by early American writers called *Aecidium Cratægi*, var. and by later writers *Ræstelia lacerata*. Plants so designated are not the same as European species with these names. Some of the references below are uncertain but it is not unlikely that a majority of citations of *Ræstelia lacerata* on *Cratægus* relate to this species. Most of the references by Berkeley in Grev. 3: 59 (101). Dec. 1874 to *Ræstelia lacerata* on *Cratægus* prove to be *Aecidium aurantiacum*. This applies to nos. 180, 182, 243 there cited, but no. 161 on *Cratægus* is *Aecidium globosum*. For account of culture experiments and results see references below, Farlow 1886, Thaxter 1887, 1889, 1891. It should be noted that the true *Aecidium laceratum* has been produced by cultures on *Cratægus* (Farlow 1886 p. 190, 238, Thaxter 1887 p. 266), but aside from this it is not definitely known on this host in America.

Aecidium Grossulariæ, (P. in Gmel.) Schum.

NOTE. Under the name *Aecidium Grossulariæ*, American writers include a number of æcidial forms, none of which can be connected with *Puccinia Ribis*, which is a *Micropuccinia*. See Eriksson, Rev. Gen. de Bot. **10**: 506. 15 Dec. 1898. The European *Aecidium Grossulariæ*, (P.) Schum. has been shown to belong to *Puccinia* on *Carex*, of which Klebahn has described several form-species. See Klebahn, Zeit. Pflanzenkr. **12**: 144. 15 July 1902 and Pringsheim, Jahrb. **34**: 388. 1902. See also Syd. Mon. Ured. **1**: 652. 1 Nov. 1903 and Klebahn, Rostpilze 295 *et seq.* 1904. See also note under *Aecidium albiperidium*, Arth.

Probably the references given below relate to *Aecidia* of heteroecious *Puccinia*, but whether the same as the European species is not known. We have arranged the citations by hosts, beginning with those in which several hosts are given. It should be said that only on *Ribes prostratum* have been frequently recorded both *Aecidium Grossulariæ* and *Puccinia Ribis* or *Puccinia pulchella*, Pk., said to be the same.

On *Ribes*, sp. plur.

***Aecidium Isnardia*, Lagerh.**

NOTE. This species of Lagerheim is apparently founded on Lea's specimen in Herb. Fries and we have placed under the name *Aecidium Isnardia*, Lagerh. all the references to *Aecidia* as quoted on *Isnardia*. It is not improbable that *Aecidium Isnardia* should be referred to *Aecidium Ludwigia*, Ell. & Ev. published two years earlier, but the specimens of the first named species which we have examined are not sufficient to settle that point.

***Aecidium* on *Larix*:**

Mayr, Waldungen von Nordamer. 221. 1890.

Aecidium lateripes, Kellerm.

NOTE. This name is given to an *aecidium* produced on *Ruellia strepens* by sowing teleutospores of *Puccinia lateripes*, B. & Rav. from the same host-plant. See also Kellerm. Jour. Myc. 9: 107-109. 29 May 1903. See also Carl. Tr. Kans. Acad. 14: 44. 1896. See also *Aecidium Tracyanum*, Syd.

Kellerm. Jour. Myc. 9: 234, 238. 31 Dec. 1903.

Aecidium lauratum, Watt.

NOTE. This is a mere catalogue name and there is no clue to its identity.

Watt, Can. Nat. & Geol. II. 2: 391. Oct. 1865.

***Aecidium* on *Leechea*.**

NOTE. Berkeley in Grev. 3: 60 (102). Dec. 1874 reports an *Aecidium* on *Leechea* which is quoted by Syd., Sacc. Syll. 13: 647. 1898. The name given is *Aecidium Compositarum*. There is probably an error in the name of the host.

Aecidium Ledi, Herb. Auerswald.

NOTE. This species was never described, but is cited in Beitr. Biol. Pflanzen 3: 52. 1883. There Schreeter states that it is the same as the uredo of *Chrysomyxa Ledi*, (A. & S.) D By.; but in Ber. Schles. Ges. 1887: 279 he refers it to *Uredo ledicola*, Pk.

***Aecidia* on *Leguminosæ*.**

NOTE. The confusion and uncertainty which prevail among American mycologists in the use of old European names of *Aecidia* on *Leguminosæ*, such as *Aecidium Leguminosarum*, *Aecidium Orobi*, etc., is so great that we have here arranged the *Aecidia* which have been reported on species of that order alphabetically by hosts, giving also for convenience cross references to the species whose literature is comparatively clear.

***Aecidium* on *Leguminosæ*, sp. indet.**

***Accidium Lysimachiæ*, S.**

NOTE. *Accidium Lysimachiæ*, (Schl.) Wallr., which dates from 1823, is considered in Europe to be the æcidium of *Puccinia Limosæ*, Magn. *Accidium Lysimachiæ*, S. dates from 1822, and, if the two are identical, the latter name has priority; but Schweinitzian specimens which we have seen are not in good condition. We have therefore here inserted the references given by writers as *Accidium Lysimachiæ*, S., and added with doubt American references to *Accidium Lysimachiæ*, (Schl.) Wallr.

Aecidium Oenotheræ, Pk.

NOTE. The name *Aecidium Oenotheræ*, Pk. was changed by De Toni in 1888 to *Aecidium Peckii* on the supposition that it was different from the earlier described *Aecidium Oenotheræ*, Mont. But *Peridermium Peckii*, Thm. here given as *Aecidium* dates from 1880. It is not certain whether any of the North American *Aecidia* on *Oenothera* really belong to *Aecidium Oenotheræ*, Mont. but at least the greater part of them are certainly *Aecidium Oenotheræ*, Pk. which according to Kellerman is connected with a *Puccinia* on *Carex* called by him *Puccinia Peckii*.

We have therefore thought best to retain as an index name *Aecidium Oenotheræ*, Pk. without regard to Montagne's name in order to avoid creating still greater confusion in the synonymy. For further references see also *Aecidium Epilobii*. See Kellerman, Jour. Myc. 8: 20. 31 May 1902 and 9: 9. 14 Feb. 1903. Arth. Jour. Myc. 8: 52. 30 June 1902 and Bot. Gaz. 35: 13. 20 Jan. 1903. Syd. See *Aecidium Solani*, Mont.

Aecidium Physalidis, Pk.

NOTE. This name which so far as we know occurs only in the citation below probably refers to the aecidium of *Puccinia Physalidis*, Pk., which is perhaps the same as *Aecidium Solani*, Mont.; but authors are not agreed on that point.

Stuart, Proc. Ind. Acad. 1901 : 284. 1902.

Aecidium Pimpinellæ, Auct. Amer.

See *Aecidium Osmorrhizæ*, Pk.

Aecidium Pini, Auct. Amer. p. p.

NOTE. Besides citations under cross references given below there are the following references to *Aecidium Pini* in North America. Some relate to corticolous and some to acicolous forms, but their development has not been studied in this country. In Europe *Aecidium Pini* has been separated into a number of forms, the acicolous being in general connected with species of *Coleosporium* and the corticolous with species of *Cronartium*. For details see Klebahn, Rostpilze 358, 372, 377. 1904.

In this country *Coleosporium Senecionis* appears to be rare and is not accompanied, so far as known, by any *Aecidium* on leaves of *Pinus*; nor has it been ascertained whether the common species of *Cronartium* on *Myrica* is connected with the common form of *Aecidium Pini* on *Pinus rigida* with which it is often found growing. It should be remarked that the common

Aecidium in the latter case is acicolous and not like the corresponding European form corticolous.

We have arranged the following references under three heads: those where the *Aecidium* is reported on bark, those on leaves and lastly miscellanea. Probably some of the references properly belong to certain of the species already given here as cross references.

Corticolous forms.

Aecidium piratum, S.

NOTE. Under *Aecidium piratum* are given the references to the *Aecidium* of *Gymnosporangium macropus*, but, as the names *Aecidium piratum* and *Aecidium penicillatum*, the latter being in fact the name of a European species not found in North America, have been confused by some American writers, some of the following references may belong to other species.

Aecidium Hamiltoniae, Thm.

Thm. Bull. Torr. Bot. Club **6**: 350. d. Oct. 1879.

De Toni in Sacc. Syll. **7**: 822. d. 28 Oct. 1888.

Aecidium quadrifidum, D C.

See *Aecidium punctatum*, P.

Aecidium Ranunculacearum, Auct. Amer. p. p.

NOTE. The Aecidia on American species of *Ranunculus*, with the exception of *Aecidium Ranunculi*, S., are in great confusion. The name *Aecidium Ranunculacearum* has been rather indefinitely applied to forms occurring on *Ranunculus*, *Anemone* and *Thalictrum*. In Europe *Aecidium Ranunculacearum* has been segregated into forms connected with *Puccinia perplexans*, Plowr., *Uromyces Dactylidis*, Othh and *Uromyces Poae*, Rabb. See Syd. Mon. Ured. **1**: 719. 1 Nov. 1903, Klebahn, Rostpilze 274, 323, 324. 1904. Some of our *Aecidia* on *Ranunculus* seem to be the same as European forms

but as the references in American literature are uncertain we have arranged them by hosts.

The references to *Aecidium Ranunculacearum* on *Anemone* with the exception of the form connected with *Puccinia simillima*, Arth. are also doubtful. An *Aecidium* on *Anemone Caroliniana* is described by Sydow as the æcidial stage of *Puccinia cohasa*, Long, q. v.

For the *Aecidia* on species of *Thalictrum* see *Aecidium Aikeni*, Syd., *Aecidium Sommerfeltii*, Joh., *Aecidium Thalictri-flavi*, (D C.) Wint. and *Aecidium punctatum*, P.

***Aecidium Saniculae*, Carm.**
 NOTE. *Aecidium Saniculae*, Carm. of Europe is considered to be the æcidium of *Puccinia Saniculae*, Grev. In North America the latter species, at least according to later European mycologists, does not occur; but the *Aecidium* called by American mycologists *Aecidium Saniculae* may be connected with *Puccinia Marylandica*, Lindr. or possibly with *Puccinia microica*, Ell.

 NOTE. The *Aecidium* on *Smilax herbacea* and *S. hispida* is said by Arthur
 to belong to *Puccinia amphigena*, Diet. It differs from the authentic speci-
 men of *Aecidium Smilacis*, S. which we have examined, in not causing ver-
 ruciform distortions of the leaves but, as far as the microscopic characters of
 the spores are concerned, they appear to be the same; for although in the
 Schweinitzian specimen they were hardly mature, they at least were smaller
 and wanting in the thickening of the apical wall found in *Aecidium macrospo-*
rum, Pk. See also Syd. Mon. Ured. **1**: 742. 1 Nov. 1903. Klebahn, Rost-

Aecidium Solani, Mont.

NOTE. Whether American writers are correct in referring the *Aecidium* on *Physalis* in North America to *Aecidium Solani*, Mont. 1852, is doubtful. The *Aecidium* on *Physalis*, whatever it may be called, is generally considered to belong to *Puccinia Physalidis*, Pk.

In Harkness, 1885, and Seymour, 1896, given below, the host is *Solanum*. Harkness considered his *Aecidium* to belong to *Puccinia Solani*, Cke. 1878, but there is an earlier *Puccinia Solani*, B. & C. 1853, based on specimens from Surinam in Herb. Schweinitz.

Aecidium Sommerfeltii, Joh.

NOTE. There are at least two species of *Aecidium* on species of *Thalictrum* in North America; *Aecidium Sommerfeltii*, Joh. 1884 based on *Cæoma Thalictri*, Sommf. 1826 and *Aecidium Thalictri-flavi*, Wint. based on *Aecidium Ranunculacearum*, var. *Thalictri-flavi*, D C. 1815, from which *Aecidium Thalictri*, Grev. 1823 appears not to differ.

We use the name *Aecidium Sommerfeltii*, Joh. for the species which occurs on *Thalictrum alpinum* in Greenland and the northern and higher parts of America and possibly on some other hosts.

American mycologists have as a rule followed De Toni who refers to *Aecidium Sommerfeltii* all *Aecidia* on *Thalictrum* in Europe and North America, but others have used the name *Aecidium Thalictri* in the sense in which we here use the name *Aecidium Thalictri-flavi*.

Of the *Aecidia* on *Thalictrum Fendleri*, referred variously to *Aecidium Sommerfeltii* and *Aecidium Thalictri*, the specimens we have seen seem to be *Aecidium Thalictri-flavi*; but in some cases genuine *Aecidium Sommerfeltii* appears to have been found on that host.

According to Juel Oefv. K. Vet.-Akad. Foerh. 52: 383. 1885, *Aecidium Sommerfeltii* is the *Aecidium* of *Puccinia septentrionalis*, Juel on *Polygonum viviparum*. See also Syd. Mon. Ured. 1: 575. 15 May 1903, Klebahn, Rostpilze 321. 1904.

NOTE. In assigning the authority to the specific combinations of species here cross-referred from *Agaricus* to other genera we have in general cited the author by whom the species were placed under the names given, regardless of the question whether he considered the names to represent genera or subgenera, the plan followed in Saccardo's Sylloge and by a large number of writers. This we have found to be the only practical method, for since we believe that the present classification of *Agaricaceæ* is of necessity only provisional and temporary, it would be a waste of time to attempt to search through the innumerable scattered lists, monographs and other small papers of Euro-

pean writers of the last century, to settle points in regard to species common to both countries which could at the best have only a slight value. An examination of the writings of those who have attempted to give as authorities for the species of *Agaricaceæ* only those who accepted the genera now adopted as genera rather than subgenera has shown so many inconsistencies and inaccuracies that we have not been able to follow them.

For uniformity's sake we have followed the same plan in regard to the purely North American species, but in this case, as all American references known to us are given, with dates, the reader has the means of settling the question of authority for himself.

As used here in its limited sense we have kept under *Agaricus* the species placed by mycologists in *Psalliota* and *Pratella*, the type of the genus being *Agaricus campestris*, L.

Agaricus cæspitosus, (B.) M. A. Curtis, Bot. N. Car.

See *Pleurotus cæspitosus*, Sacc. Syll.

NOTE. This is *Agaricus cæspitosus*, M. A. Curtis, Bot. N. Car. 85 where it is placed under the subgenus *Clitocybe*. The plant referred to was *Lentinus cæspitosus*, B. Decades 120 in Lond. Jour. Bot. 6: 317 (6). 1847, a species the synonymy of which is complicated. See notes under *Lentinus cæspitosus*, B. and *Pleurotus cæspitosus*, Sacc. Syll.

NOTE. This is considered by Fries to be a variety of *Agaricus campestris*, L.

Psallota exserta, Fr.

Lloyd, Myc. Notes 28. d. Nov. 1899.

Agaricus fabaceus, B.

NOTE. We have placed here the references to *Agaricus amygdalinus*, M. A. Curtis of which no description was ever published by Curtis but which he later considered, as shown by notes in his herbarium, to be really *Agaricus fabaceus*, B. *Agaricus subrufescens*, Pk. is certainly closely related to what is here classed under *Agaricus fabaceus* and inasmuch as it is not possible at present to settle the points of distinction, all references to these species are placed together since one studying the subject should examine them all.

- Agyrium**, Fr.
 NOTE. The genus *Agyrium* was by some of the earlier writers regarded as belonging to Lichens while others regarded it as belonging to Fungi. For notes as to its relation to Lichens see Tuck. Gen. Lich. 225. 1872.
- Agyrium atrovirens**, Fr.
 NOTE. The reference in Schweinitz below is to the *Agyrium atrovirens* of Fr. S.M. 2 : 232. 1822 which was later considered by Fr. El. 2 : 25. 1830 to be an abortive form of *Stictis Pupula*, Fr. Other references to *Agyrium atrovirens* are to be found under *Cryptodiscus atrovirens*, (Fr.) Cda. and *Propolidium atrovirens*, (Fr.) Rehm.

Agyrium lacteum, Fr.

NOTE. The only information we have of this species is a description contained in a short account in Fries, Summa 480. 1846 where it occurs in a foot note under *Diaphanum*. This is repeated in Sacc. Syll. 4: 672. 10 April 1886. The specimen labeled *Agyrium lacteum* from Herb. Schweinitz which we have examined is on the stem of some unknown herbaceous plant and is *Cylindrocolla Urticae*, (P.) Bon.

Albugo Convolvulacearum, Henn.

See *Albugo Ipomœæ-panduranæ*, (S.) Swingle.

Albugo Ipomœæ-panduranæ, (S.) Swingle.

NOTE. For notes on the structure of *Accidium Ipomœæ-panduranæ*, S. which some writers even at the present date quote incorrectly as a true *Accidium*, see Farl. Bot. Gaz. **14** : 187-189. 16 Aug. 1889.

Whether *Cystopus Convolvulacearum*, Speg. is specifically distinct from this species as supposed by some mycologists seems to us doubtful and at least the no. 1809 N. A. F. and 501 Rav. Fung. Am. cited by Berlese in Riv. Patol. Veg. **9** : 25 under *C. Convolvulacearum* seem to us to be *Albugo Ipomœæ-panduranæ* as is probably also *Albugo Convolvulacearum* of Hennings given below.

NOTE. Under the name *Michenera Artocreas*, B. & C. this was made the type of the genus *Michenera*, a genus which, so far as the type species at least is concerned, cannot be accepted. *Michenera Artocreas* as shown by cultures is undoubtedly merely a conidial form of a *Corticium*, probably *C. subgiganteum*, B. and the references to the conidial stage as given below are inserted here provisionally for convenience.

Alternaria fasciculata, (C. & E.) Jones & Grout.

NOTE. This species and *Alternaria Solani* have been confused by various writers, some considering them to be the same, others writing so vaguely that it is impossible to state with certainty what species is implied. The present arrangement of these two species depends chiefly on the results of cultures and the synonymy given by Jones, 1896, 1897, 1898, 1899.

West Indies.

***Alysidium*, Kze.**

NOTE. This genus was founded on *Alysidium fulvum*, Kze. of which the North American references are given below. As limited by some authors it includes certain species referred to *Oidium*, *Oospora*, etc. Since all the fungi of this group are either known or suspected to be imperfect forms of higher fungi it seems to us unnecessary to attempt to settle the question as to what is the oldest name of the genus to which they might be referred and we have preferred to retain most of them in *Oospora*, the genus under which several of our species were first described and under which they are to be found in most recent works.

***Alysidium albipes*, Pound & Clements.**

See *Oospora albipes*, (Pk.) Sacc.

Amanita aterrima, Raf.
Raf. Précis 49. d. 1814.

NOTE. It is impossible to recognize from the original descriptions either this species or *Amanita azurea*, Raf. It may be said, however, that neither of them appears to be an *Amanita* in the modern sense.

Amanita aurantiaca, S.
See *Amanita cæsarea*, (Scop.) P.

Amanita azurea, Raf.
Raf. Précis 49. d. 1814.

Amanita baccata, Fr.
See *Amanitopsis baccata*, (Fr.) Sacc.

Amanita badia, P.
See *Amanitopsis vaginata*, (Bull.) Roze.

Amanita bulbosa, P.

NOTE. It is difficult to say with certainty to what species of later writers the *Amanita bulbosa* of Persoon is to be referred but as far as we can ascertain it is considered to be the same as *Amanita Mappa*, (Batsch.) Fr. The *Agaricus bulbosus* of Bulliard as represented by his plates no. 2 and 577 is in part *Amanita phalloides* and in part *Amanita Mappa*.

In Lloyd, Volvæ 21. 1898 *Amanita bulbosa*, Rav. is said to be the same as *Amanita Ravenelii*, B. & C. but we have no note as to where an *Amanita bulbosa*, Rav. was ever printed.

See also the references given under *Amanita phalloides* to *Amanita bulbosa*, Auct. Amer. and note under *Amanita solitaria*, (Bull.) Fr.

Amanita soleata, Howe.See *Amanitopsis volvata*, (Pk.) Sacc.**Amanita solitaria**, (Bull.) Fr.

NOTE. The *Agaricus bulbosus*, Schæff., listed by Muhlenberg, 1799 is referred by Streinz to *Amanita solitaria*, (Bull.) Fr. The American references to *Amanita solitaria* and *Amanita strobiliformis* are very much confused and in fact the distinctions between these two species as given by European authors are far from clear. It seems to us that it may be assumed that some of the references here given under both these species are open to question. See note under *Amanita bulbosa*, P. Is not *Clitocybe solitaria*, Jelliffe, Fl. L. I. 42. 1899 a misprint for *Amanita solitaria*?

Ampelomyces quisqualis, Ces.

NOTE. The name *Ampelomyces quisqualis*, Ces. given in Klotzsch Herb. Viv. Myc. 1669. 1852 and also in Bot. Zeit. 10: 301. 23 April 1852 certainly antedates *Cicinnobolus*, Ehrh. which did not appear until the following year (Bot. Zeit. 11: 16. 7 Jan. 1853) and then in a very vague way.

The true structure and position of the genus *Cicinnobolus* were first given by De Bary in Beitr. Morph. und Phys. der Pilze 3: 53-75. *pl. 11, 12.* 1870 where he called the species *Cicinnobolus Cesatii*. In our opinion the name *Cicinnobolus Cesatii*, D By. is the name which should be preferred to any other but we do not agree with De Bary in referring the genus to Ehrenberg but consider that he is himself the real author of the genus.

Amphisphæria caryophaga, Cke.See *Trematosphæria caryophaga*, (S.) Sacc.**Amphisphæria conferta**, (S.) Sacc.

NOTE. The *Sphæria conferta* of Schweinitz, Syn. Car. 187 was said by Schweinitz to be the same as the *Sphæria confertula*, S. Am. Bor. 1508. The *Sphæria conferta* of S. Am. Bor. 1477 according to Ellis and to our own examination of an original specimen is immature *Sphærella maculiformis*, (P.) Awd.

With regard to *Sphæria conferta*, S. Syn. Car. 187, the spores are said by Cooke, Grev. 15: 81. *d.* March 1887 to be two-parted and on this authority it forms the basis of *Amphisphæria conferta*, (S.) Sacc. Starbæck, 1894, found no spores in Schweinitzian specimens but noted a marked resemblance externally to *Sphæria euomphala*, B. & C. Ellis in Proc. Phil. Acad. 1895: 25 (6). 21 Feb. 1895 gives details of spores of *Sphæria confertula* from Pennsylvania and expresses a doubt whether it is the same as the North Carolina specimens of that name.

We have examined a specimen of *S. confertula* (*S. conferta*, S. Syn. Car.) from Carolina and the external resemblance to *S. euomphala* is marked, as stated by Starbæck but the spores do not agree either with those described by Cooke or with those described by Ellis. Two kinds of spores were seen; one dark-colored, elliptic, 8-9 μ , by 2.8 μ , filling the perithecium but no asci were seen and in one case slender, clavate asci 84 μ long by 7 μ broad with hyaline acicular spores 14-16 μ by 2.8 μ , 6- to 8-guttulate but not clearly septate.

From the above it will be seen that it is hopeless to expect to be able to recognize what Schweinitz understood by *S. conferta* and *S. confertula*. We have given below the synonymy based on Cooke's notes on the spores but we do not believe that the species is an *Amphisphæria* nor that any one at the present day can say to what genus it belongs. It should be placed permanently under *species ignota*.

Anixia.

NOTE. The genus *Anixia* was originally defined by Fries. If the modern genus is to be credited to Fries it can be only to Fries in Hoffmann, Icones Anal. **3** : 70. 1863 as is done by Lindau in Engler & Prantl, Pflanzenfam. **1**¹ : 333. Jan. 1897. Since the genus as at present understood is based on *Didymium parietinum*, Schrader, it may be questioned whether it would not be better to retain the genus *Anixia* for the ill-defined species first proposed by Fries and, following Rostafinski, to raise to generic rank the subgenus *Myogala* of Fries in Summa Veg. Scand. **448**. 1846 which included only the original *Didymium parietinum* of Schrader but one could

not follow Rostafinski in substituting for Schrader's name that of *bicolor* taken from the later *Licea bicolor* of Persoon.

Of the two North American species referred to *Anixia*, *A. interrupta* can not belong to the genus in the modern sense, judging by the description of Schweinitz. We have seen no specimen however. Of the second species we know but a single published record although it has been collected several times in this country. It is the same as *Anixia parietina*, (Schrad.) Lindau.

The spelling of *Myogala* has been changed to *Mycogala* in certain references, whether on etymological grounds or not we do not know; but the *Mycogala parietinum* of Sacc. Syll. 3: 185. d. 15 Dec. 1884 placed in *Fungi Imperfecti* can not be as stated by him the *Myogala bicolor* of Rostafinski, Mycetozoa 301. 1875 since Rostafinski included the *A. truncigena* of Hoffmann, which is ascosporic.

Anixia interrupta, S.

S. Syn. Am. Bor. 264 no. 2395. d. 1834.

Antennatula arctica, Rostr.

See *Antennularia arctica*, (Rostr.) n. n.

Antennularia, Reichenbach.

NOTE. Unless one adopts the principle that the same name may be applied to genera both of fungi and of phænogams — a principle in favor of which something might be said — the genus *Antennaria* of *Fungi* can not stand since *Antennaria*, Lk. 1809 is antedated by *Antennaria*, Gærtner 1791, a genus of *Compositæ*.

Reichenbach in 1828 substituted for *Antennaria*, Lk. the name *Antennularia* which he afterwards changed to *Antennataria*, there being an earlier genus of animals of the former name. According to modern views the change was not required and therefore the oldest name for the heterogeneous collection of species classed by mycologists under *Antennaria* is *Antennularia* rather than the more recent *Antennina*, Fr., *Antennula*, Strauss and *Antennatula*, Strauss.

The species of *Antennaria* are placed by some writers, as Rostrup, in *Hyphomycetæ* and by others, as Saccardo and Lindau, in *Perisporiaceæ*, although of the thirteen species recognized by Lindau only one is known to have asci. As it is, the genus is merely a temporary resting place for a number of imperfect forms and for the sake of uniformity in generic nomenclature and to avoid the use of a name better known in phænogams than in fungi we have adopted the name *Antennularia*.

Antennaria elæophila, Mont.

Halsted, Bull. Iowa Agr. Coll. 1888: 118. April 1888.

Antennularia Guava, (Cke.) n. n.

NOTE. This species was described without special locality in a paper on California fungi. The material is apparently the same as that cited by Harkness and Moore, 1880, where the locality given is Hawaii not California. Whether the species really occurs in the United States is not certain. The spelling given by Harkness and Moore is *Guavæ* and the spelling *Guava* is probably a printer's error.

Anthostoma Closterium, B. & C.

See *Anthostomella Closterium*, (B. & C.) Sacc.

Anthostoma discineolum, (S.) Sacc.

NOTE. There is no reason to suppose that this species founded on *Spharia discincola*, S. is really an *Anthostoma* but whether it is the same as *Spharia discreta*, S. is open to doubt. On the strength of Schweinitzian material examined by Currey and Cooke, *S. discincola* and *S. discreta* are the same and in that case the former name has priority. Cooke, however, retains both names whence it might be inferred that he had doubts as to whether the material examined by him was really the *S. discincola* of Schweinitz Syn. Car. Tulasne places the *S. discincola* of Herb. Mus. Paris received from Schweinitz in *Nummularia discreta* but believes that it is not the true *S. discincola* of S. Syn. Car.

We are obliged therefore to consider the *S. discincola*, S. as a doubtful species which on the authority of Schweinitz and Fries is distinct from *S. discreta* but whose exact characters can not be ascertained at the present time. It is here referred to *Nummularia discreta* as a doubtful synonym since the commonly accepted name *discreta* should not be superseded by the very uncertain *discincola* published earlier.

Sacc. Syll. 17 : 595. d. 25 May 1905.

Anthraeoidea, Bref.See *Cintractia*, Cornu.**Anthraeoidea Caricis**, Bref.See *Cintractia Caricis*, (P.) Magn.**Anthraeoidea subinclusa**, Bref.See *Cintractia subinclusa*, (Koern.) Magn.**Anthracophyllum Nigrita**, (Lév.) Kalchb.

NOTE. The genus *Anthracophyllum* is by some recent writers kept distinct from *Xerotus* but it is considered by Patouillard, Essai Tax. 146. 1900, to be merely a subgenus of *Xerotus*. If kept distinct it is not easy to state what are the generic characters. Hennings in Engler and Prantl, Pflanzenfam. 1^{1**} : 222. 1898 makes a distinction on the spores which in *Anthracophyllum* are said to be black and in *Xerotus* colorless; but according to Patouillard the spores in both cases are colorless.

Although we have never seen living material, in all the herbarium material which we have seen of *Xerotus Nigrita*, the type of *Anthracophyllum*, the spores were certainly not black nor even opaque. The generic distinction founded on the relative position of the stipe and pileus hardly seems to be of importance in this case as there are so many transitional stages. It seems to us better then to retain the name *Xerotus Nigrita*, Lév., *q. v.*

Anthurus borealis, Burt.

NOTE. The differences between the genera *Anthurus* and *Lysurus* are certainly slight and the variety *Klitzingii*, Henn. of *Anthurus borealis* is by him placed in the genus *Lysurus* in Hedw. Beibl. 41 : (173). Oct. 1902.

Burt, Mem. Boston Soc. 3 : 487-505. d. pl. 49, f. 1-14. pl. 50, f. 15-18, 20-23. Oct. 1894.

Arachnion, S.

NOTE. Brongniart in Essai d'une Classification Nat. des Champ. places *Acinophora* of Rafinesque as a synonym of *Arachnion*, in which he has been followed by some later writers. Brongniart remarks however that it is impossible to tell from the description what *Acinophora* really is, an opinion in which we quite concur.

Areyodes, O. F. Cook.

Cook, O. F., *Science II.* **15**: 651. 25 April 1902.

Areyodes incarnata, (A. & S.) O. F. Cook.

NOTE. In the reference given below the name *Arcyodes* is proposed to replace *Lachnobolus* as understood by Lister. Whether the type species which is based on the old *Licea incarnata*, A. & S. referred to *Lachnobolus circinans*, Fr. by Lister is found in North America is a point on which opinions differ. The species quoted from Iowa under *Lachnobolus circinans*, Lister is by Macbride considered to be a different species peculiar to America which he calls *Lachnobolus occidentalis*, Macbr. See *Lachnobolus*, sp.

***Aregma*, Fr.**

NOTE. The genus *Aregma* was described by Fries in his *Observationes* 1: 225. 1815. The genus *Phragmidium* was described by Link in *Ges. Nat. Freunde Mag.* 7: 30. The date of this volume is given as 1816 on the title-page of the volume and this date has generally been accepted as correct. Fries however in *Systema Mycologicum* 3: 495. 1832 makes the statement that *Aregma* and *Phragmidium* were published in the same year from which one might infer that that part of volume 7 including Link's paper was issued earlier than 1816. The volume is in four parts of which part one including *Phragmidium* has the title "Erstes Quartal, Jan., Feb., März, 1813." It may therefore be the case that it is to an earlier edition of the *Erstes Quartal* issued in advance of the volume to which Fries refers. In the *Summa*, 507. 1849 Fries adopted the name *Phragmidium* including his *Aregma*. We have referred our species of *Aregma* to *Phragmidium*, that name being accepted by most writers.

Aregma disciflora, Arth.

NOTE. This name, founded on *Ascophora disciflora*, Tode Fung. Meckl. 1; 16. *d. pl. 3, f. 26, 27.* 1790 has been employed by Arthur in Indiana Plant Rusts, 1899 and 1904 to designate *Phragmidium subcorticium*, (Schrank) Wint.

The description and figures of Tode are wholly inadequate for the recognition of any one species and include forms on both *Rubus* and *Rosa*.

Tode's species is a composite considered by Streinz to be a synonym of *Phragmidium incrassatum*, Lk. a parasite of *Rubus* and by Arthur to designate one of the species parasitic on *Rosa* so that evidently it should not replace any of the more accurate names of modern usage.

On page 116 the name *cheimonophylla* was erroneously written by me *cheimonophila*. A. B. S.**Armillaria cheimonophylla, B. & C.**

NOTE. This species which has no annulus as shown by an examination of original specimens is not a true *Armillaria*. It is placed by Patouillard (1887) in *Mucidula*, a genus based by him on *Armillaria mucida*, (Schrad.) Fr., a species reported in the United States but not common, which differs from *A. cheimonophylla*, B. & C. in having an annulus although agreeing with it in some other respects.

 Kuntze, O., Rev. Gen. Pl. 2 : 861. 1891.
- Armillaria mellea*, (Vahl) Fr.**

NOTE. The sclerotoid condition of this species is the *Rhizomorpha subcorticalis* of older mycologists and we have for convenience inserted here the North American references to that *Rhizomorpha* but without intending to imply that in all cases cited the *Rhizomorpha* belongs beyond doubt to *Armillaria mellea*.

A difficulty in the synonymy arises from the fact that while *Armillaria mellea* normally has an annulus, specimens are occasionally found belonging undoubtedly to this species but in which the annulus is wanting.

There are other cases of forms referred to *Clitocybe* by some writers in consequence of the absence of an annulus, although in other respects certainly closely related to *Armillaria mellea*. Whether such forms are to be regarded as distinct species or merely as forms of *Armillaria mellea* is a matter of individual judgment. Peck in Rept. N. Y. Mus. 46 : 134 (54). Dec. 1893 proposed the name *Armillaria mellea*, var. *exannulata* to include such forms. Later in Rept. N. Y. Mus. 51 : 284, 302. 11 Feb. 1899 he expresses the opinion that *Clitocybe monadelpha*, Morg. is distinct. We have here brought together all the references to *Clitocybe monadelpha* and *Clitocybe aquatica* since they need to be consulted in connection with *Armillaria mellea*.

It should be remarked that this species was placed by Karsten (1879) in the genus *Armillariella* characterized by an annulus and decurrent gills as distinguished from forms like *Armillaria robusta*, (A. & S.) Fr. in which the gills are not decurrent.

Arrhenia tenella, Fr.

NOTE. The genus *Arrhenia* is differently limited by different writers. The species given below is placed by Quélet in *Dictyolus*. Otto Kuntze substitutes *Auriscalpium*, S. F. Gray for *Arrhenia*, Fr. but *Auriscalpium*, S. F. Gray is based on *Hydnum Auriscalpium*, L. which is an entirely different plant from *Arrhenia Auriscalpium*, Fr., the type of *Arrhenia*.

Kuntze, O., Rev. Gen. Pl. 3² : 446. 1898.

Arrhytidia, B. & C.

NOTE. The genus *Arrhytidia* is placed by Patouillard, Essai Tax. 30. 1900 in *Guepiniopsis*, Pat. In regard to *Arrhytidia flava* given below an examination of the original specimen shows that although it belongs to the *Dacryomycetinea* it does not seem to be a genuine *Guepiniopsis*. Whether *Arrhytidia* can be regarded as a good genus can not be satisfactorily determined until its development is better known.

Cke. Bull. Buf. Soc. 3 : 201. July 1877.

Arthonia confluens, Auct. Amer. p. p.

NOTE. The genus *Arthonia* has usually been considered to belong to lichens although some modern writers consider that at least part of the species should be regarded as fungi. In the two citations given below *Peziza pruinata*, S. is said to be *Arthonia confluens*, a statement difficult to understand since *P. pruinata* is properly considered to be a synonym of *Solenia poriaformis*, (P.) Fckl. and is not related in the least to *Arthonia*.

Furthermore from the citations below it is not possible to say which of the several species known at different times under the name *Arthonia confluens* is referred to. Apparently as used by lichenologists at the present day that name is a synonym of different species of *Opograpta* and *Graphis*.

For North American species of *Arthonia* from a lichenological point of view see Synopsis of the Genus *Arthonia* by Henry Willey, 1890.

Arthrobotrys oligospora, Fres.

Farl. Bull. Bussey Inst. 1 : 439. March 1876.

Arthrobotryum, Ces.

NOTE. The genus *Arthrobotryum*, attributed by various mycologists to Cesati, was originally described, although rather vaguely, in Klotzsch Herb. Viv. Myc. no. 1821. 1854, under the generic name *Arthrographium* and the description was repeated in Bot. Zeit. 12 : 186. 1854. In both places is quoted the figure in Hedwigia 1 : pl. 4, f. 3 (error for f. 1) which is called *Arthrobotryum stilboides* without notes or description. As it is doubtful whether the generic characters as understood by Cesati could be recognized from the figure alone it might be questioned whether *Arthrographium* should not replace *Arthrobotryum*. Since the latter name has been constantly used by subsequent mycologists, not always perhaps in the same sense as used by Cesati, we have not thought it best to abandon the name.

Some of the North American species which have been by some writers included in *Arthrobotryum* do not appear to us to be congeneric with *A. stilboides*, especially those here referred to *Arthrosporium*.

Whether *Didymobotryum*, Sacc. Syll. 4 : 626. d. 10 April 1886 should be considered distinct from *Arthrobotryum* is so far as North American species are concerned doubtful and we have placed the North American species of *Didymobotryum* under the present genus.

Pound & Clements, Minn. Bot. Studies 9 : 728. d. 31 May 1897.

Arthrobotryum compositum, Pound & Clements.See *Arthrosporium compositum*, Ell.**Arthrobotryum didymum**, (Cke.) Pound & Clements.

NOTE. We have not been able to examine an authentic specimen of this species but the spores are said to be 1-septate and for this reason it is placed by Saccardo in *Didymobotryum*. Since however *D. pubescens* is to be referred to *Arthrobotryum* we have preferred to place this species also in *Arthrobotryum* since, judging from the described species, the grounds on which *Didymobotryum* is separated from *Arthrobotryum* seem hardly adequate.

See *Aleurodiscus Micheneri*, (B. & C.) Masee.

Artotrogus, Mont.

NOTE. We here refer the species of *Artotrogus* to *Pythium*, Pringsh. for the reason that by any other course we should increase bibliographical difficulties already very great. The original *Artotrogus* of Montagne in B. Jour. Hort. Soc. London **1**: 33. *pl.* 4, *f.* 27-29. 1846 and Gard. Chron. **1845**: 640. 20 Sept. 1845 was very vaguely described and even with the more detailed information given by DeBary who examined Montagne's material one is not able to say with certainty what the type species, *Artotrogus hydno-sporus*, Mont. really was.

Otto Kuntze in Rev. Gen. Pl. **3**²: 443. 1898 refers to *Artotrogus*, Fr. S. O. V. 497. 1825. Fries was not the author of the genus. The citation in Kuntze is an error and should have been Fries, Summa Veg. Scand. 497. 1849 in which place Fries refers to Montagne as the author of the genus adding a second species now known to be the conidial form of *Nyctalis lycoperdoides*, (Bull.) Schrt.

Pythium as defined by Pringsheim is a genus whose characters are sufficiently well recognized at the present day and the genus is adopted by nearly all modern writers. The intricacies of the synonymy of the genus *Pythium* as used by writers previous to Pringsheim are so great that it would be a fruitless labor to attempt to straighten them out and it seems to be the part of wisdom to retain the *Pythium* of Pringsheim which has been in general use since 1858.

Ascochyta Rhei, Ell. & Ev.

NOTE. The name *Phyllosticta Rhei* has been twice used by Ellis and Everhart, first in Jour. Myc. 5: 145. 1889 and again in Proc. Phil. Acad. 1891: 77. March 1891. The former was made the basis of *Ascochyta Rhei*, Ell. & Ev. 1893. An attempt has been made to connect the name *Phyllosticta Halstediana* with one of the descriptions and this has resulted in confusion. In Ell. & Ev. Fung. Columb. 1254. May 1898 both descriptions are referred to *Ascochyta Rhei*. A. B. S.

Ascochyta Solidaginum, (S.) Starb.

NOTE. We have given below the synonymy of this species founded on *Spharia Solidaginum*, S. in accordance with the examination of Schweinitzian and other material made by Starbäck, 1894. But we should say that our own examination of *Spharia Solidaginum*, S. and *Dothidea Solidaginis*, S. from Herb. Schweinitz does not agree in several respects with the observations of Starbäck.

The fungus instead of forming spots in the leaves is, in many cases at least, a parasite on the common *Coleosporium* of *Solidago* recently designated as *Stichospora Solidaginis*, (S.) Diet.

Amongst the synonyms enumerated by Starbäck is *Septoria Solidaginis*, Thm. An examination of the authentic specimen of Thuemen in Myc. Univ. 1399. 1879 shows however a *Darluca* parasitic on *Coleosporium*. Whether it can be referred to *Darluca Filum*, (Biv.) Cast. is not beyond doubt but it certainly is closely related to that species and it must be admitted that Starbäck's figure suggests possibly a *Darluca*. The specimen of *Septoria*

Solidaginis, Cke. in Rav. Fung. Am. 784. 1882, shows no fungus which can be recognized. Specimens in other, exsiccati resemble that in *Mycotheca Universalis*. In many cases there accompanies the pycnidial form a sclerotium form whose relation to the pycnidial form needs to be further studied.

It seems to us therefore that the true character of *Sphaeria Solidaginum*, S. is not yet clearly settled but we are inclined to believe that it is a *Dartluca* accompanying the common *Coleosporium*. If that is not the case it is doubtful whether it will ever be possible to determine from Schweinitzian specimens what *Sphaeria Solidaginum*, S. really was.

NOTE. The genus *Ascomycetella*, Pk. Bull. Torr. Bot. Club 8 : 50. May 1881 is, as far as the type species is concerned, the same as *Cookella*, Sacc. Mich. 1 : 407. 1878. The genus *Ascomycetella* is however retained by most mycologists and the author of the genus as given by Saccardo is Ellis. This is not strictly the case. The genus *Ascomycetella* in its restricted sense is based on *A. Floridana*, Ell. but this species was considered by Ellis to be congeneric with *Ascomycetella*, Pk. The distinction between *Cookella* and *Ascomycetella* was really first given by Saccardo in Syll. 8 : 843, 846. 20 Dec. 1889 who separates them on the ground that in *Cookella* the spores are colored and in *Ascomycetella* they are subhyaline, a distinction upon which too much weight should not be placed. With regard to the limits of the genus see notes by Starbäck, Bih. K. Sv. Vet. Akad. Handl. 25³ : no. 1 : 40, 41. 1899, Hennings, Engler's Bot. Jahrb. 28 : 276. 22 May 1900 and Hedw. 40 : 354. 30 Dec. 1901.

See *Ascomycetella Floridana*, Ell.

Ascospora, Fr.

NOTE. The genus *Ascospora* has been understood in so many different senses by different authors that it is next to impossible to say to what genera some of the species probably belong.

The genus was originally founded by Fries on *Sphæria Aegopodii*, P. but this has since been shown to agree more nearly in structure with the species placed by Fries in the genus *Stigmatea*, Fr. Summa 421 than with the species placed under *Ascospora*, Fr. S. O. V. 112. 1825, Summa 425. It seems to us better to retain the genus *Stigmatea* as used by modern writers than to complicate the subject still further by reviving the genus *Ascospora*.

Asterina Lauri-Borboniæ, (S.) Cke.

NOTE. The *Dothidea Lauri-Borboniæ*, S. has been placed in *Asterina* with doubt by Cooke in *Grev.* 13: 67. March 1885 and also in *Asteroma*, Cke. *Grev.* 13: 41. Dec. 1884. Saccardo places it in *Phyllachora*.

All the specimens of *Dothidea Lauri-Borboniæ* in Herb. S. which have been examined by different writers have been imperfect and it is impossible to say what the species is and as there is no more reason for assigning it to *Asterina* than to *Asteroma* we give here all the references known to us. The species must be classed permanently with *species ignota*.

Cke. *Grev.* 13: 67. March 1885.

Asterina reptans, B. & C.

NOTE. This species is made the type of *Trichopeltis* by Spegazzini but that name so far as we know has not yet appeared in North American literature except as stated below. Whether *Asterina reptans*, Ule, Myc. Bras. 65 is the true *A. reptans*, B. & C. seems to us doubtful. We have examined Berkeley and Curtis specimens on which the species is founded and they do not seem to have the same structure as the specimen in Myc. Bras.

Asteroma venulosum, (Wallr.) Fckl.

- Davis, J. J., Tr. Wis. Acad. 9 : 166. 21 Aug. 1893.

Asteroma vernicosum, (D C.) Fckl.

NOTE. The specimen of *Dothidea vernicosa*, Fr. of the Schweinitz herbarium shows only undeveloped fungi and therefore it is uncertain whether the Schweinitzian specimen is really the *Asteroma vernicosum* of (D C.) Fckl.

- Curtis, M. A., Bot. N. Car. 118. 1867.

Dothidea vernicosa, Fr.

- S. Syn. Am. Bor. 232 no. 1900. 1834.
 Cke. Grev. 13 : 44. Dec. 1884.

Asteroma Xanthii, M. A. Curtis.

NOTE. This manuscript name appears only in M. A. Curtis, Bot. N. Car. 118 and there is no specimen of it in the Curtis herbarium. It is therefore impossible to say whether it could be the *Asteroma Xanthii*, DC. referred by Cooke in Grev. to *Puccinia Xanthii*, S.

Asterophora agaricicola, Cda.

NOTE. This is the conidial form of *Nyctalis lycoperdoides*, (Bull.) Schrt. *q. v.*

Asterophora agaricoides, Fr.

NOTE. This is the conidial form of *Nyctalis lycoperdoides*, (Bull.) Schrt. *q. v.*

Asterophora effusa, S.

NOTE. An examination of an authentic Schweinitzian specimen shows that this is not an *Asterophora* in the proper sense. It appears to be one of the conidial forms of *Polyporus* called *Plycogaster* but the Schweinitzian material is not sufficient to enable one to say certainly what species it is.

- S. Syn. Am. Bor. 263 no. 2384. d. 1834.

Asterophora nueuum, Rav.

NOTE. This is a misprint for *Ascophora nueuum*, Cda. *q. v.*

Asterophora Pezizæ, Cda.

NOTE. This species of which the earlier name is *Stephanoma strigosum*, Wallr. is the conidial form of a *Hypomyces* whose ascosporic condition has not yet been found, as far as we know, in North America. It is the species called by Tulasne, Carp. 3 : 52. 1865 *Hypomyces Pezizæ*. For the conidial stage alone the name should perhaps be *Asterophora strigosa*, (Wallr.) n. n.

 Morg. Jour. Cin. Soc. **18** : 38. *d.* Dec. 1895.

Asterostroma albidocarneum, Masee.

NOTE. This species is founded on the *Corticium albidocarneum* of Rav. Fung. Car. **4** : 14 which was supposed by Ravenel to be the same as *Thelephora albidocarnea*, S. This however is not the case as shown by Masee's examination and our own examination of authentic specimens of *Thelephora albidocarnea*, S. from Herb. S. which is not an *Asterostroma*. The true *Thelephora albidocarnea*, S. which is the *Corticium albidocarneum*, (S.) Masee is not to be confounded with the present species. The references to *Corticium albidocarneum* in American literature relate in some cases to *Corticium albidocarneum*, (S.) Masee, *g. v.* We have given here those which belong properly to *Asterostroma albidocarneum*, Masee. The citations of Morgan and Kellerman & Werner probably belong here. but we have not seen specimens representing them.

De Toni in Sacc. Syll. 7: 47. 15 March 1888.

Atractobolus ubiqitarius, Fr.

NOTE. Of the two species of the genus *Atractobolus* mentioned by Schweinitz, 1834, *A. lutescens* is not a fungus but insect eggs. *Atractobolus ubiqitarius* under which name Schweinitz quotes Fr. S. M. 2: 305. 1823 is a small *Peziza* belonging to some genus closely allied to *Mollisia*, which we are unable to determine specifically whereas in Summa 439. 1849 Fries states that his *Atractobolus ubiqitarius* is insect eggs. See also Berkeley in Entomol. Monthly Mag. 10: 183. Jan. 1874.

Mycologists do not seem to be able to recognize the original *Atractobolus ubiqitarius* of Tode of which Tode gives *Peziza annularia*, Batsch as a synonym. The plates of Tode and Batsch suggest quite as much the work of an insect as a fungus and the assumption of O. Kuntze that *Atractobolus* includes *Dasyscypha*, Fr. seems to us quite unwarranted.

NOTE. We have included under *Auricularia* species of *Hirneola* in accordance with the arrangement of Lindau in Engler & Prantl, Pflanzenfam. 1^{***}: 85. Oct. 1897 and Patouillard, Essai Tax. 14. 1900. It should be remarked however with regard to some of the species which authors have referred to *Auricularia* and *Hirneola* that their microscopic structure is not sufficiently well known to enable one to say whether they really belong to this group or not. In certain instances however an examination of authentic specimens shows that they do not belong to the *Auriculariaceae*.

We have given under *Auricularia* all the North American species known to us which have been described under *Auricularia*, *Hirneola* and *Exidia* which an examination of specimens proves to belong really to the genus *Auricularia* as well as certain species of *Hirneola* which probably belong to *Auricularia* but of which we have been unable to examine specimens and of which data in published references are insufficient to settle the genus definitely.

***Auricularia auriformis*, (S.) Earle.**

NOTE. The specimens in Wright's Cuban Fungi no. 286 referred to *Hirneola auriformis* in Fungi Cubenses p. 340 appear not to be the same as the Schweinitzian specimen on which the species is founded.

The *Exidia protracta* of L veille seems to us so far as the description shows to belong to this species as suggested by Fries in Fung. Natal. 26. 1848. The grounds of distinction given by Berkeley and Montagne in Ann. Sci. Nat. III. 11: 242 (74). 1849 in view of our examination of Schweinitzian

specimens of *Peziza auriformis* do not appear to indicate a real specific difference.

In the citation given it is stated that the *Auricularia Lesuerii*, Bory manuscript is the same as *Exidia protracta*, Lév.

Bactridium clavatum, B. & Br.

Morg. Bot. Gaz. 15 : 86. April 1890.
 McClatchie, Proc. S. Cal. Acad. 1 : 377. 5 June 1897.

Bactridium fulvellum, B.

NOTE. This was originally described apparently in Fungi Cubenses where it is said to occur also in Venezuela. An examination of Wright's Cuban specimen and Fendler's from Venezuela in Herb. Curtis shows that the Venezuela and Cuban plants are not the same species. The Cuban specimen in habit and microscopic structure is certainly very near to, if not identical with, *Bactridium flavum*.

The Venezuela specimens are branching, coralloid masses about 6 mm. in height and of a yellowish color. They are composed of a dense branching mass of hyphæ which branch dichotomo-corymbosely at the surface and have tips bearing spores composed of 8 to 14 cells and measuring 280 μ to 300 μ by 28 μ to 35 μ . It is doubtful whether this species is properly placed in the genus *Bactridium*.
